

Biarritz, June 15th, 2011

IS Decisions has released UserLock 6.0, a unique software solution that limits concurrent logins, restricts access, monitors, alerts and reports on session activity throughout the corporate Windows network.

More than 1,000,000 UserLock licenses are already in use by hundreds of security-demanding organizations worldwide, including:

BAE Systems, Banco de Costa Rica, Banco Santander, Barclays Bank, BMW, Computer Sciences Corporation, Frito-Lay, Lockheed Martin, Mitsubishi, National Bank of Kuwait, South Wales Police, Telcel, United Nations Organization, US Department of Justice, US Department of Veterans Affairs, US Navy Marine Corps, TimeWarner, etc.

About IS DECISIONS:

IS Decisions, founded in 2000 and based in Biarritz (France), is a Software Vendor specializing in Infrastructure and Security Management solutions for Microsoft Windows.

Software solutions developed for Network Administrators:

- secure, monitor and report on network access and user sessions,
- audit access to sensitive files and folders,
- perform remote installations of applications and updates across the network,
- automate the inventory of Windows assets (hardware, software, settings, eventlogs).

IS Decisions releases UserLock 6.0, the latest version of its unique software solution that provides concurrent login control and tight access security for Microsoft Windows networks.

UserLock 6.0 new features further improve the protection of corporate Windows networks against insider threat by defining and enforcing connection time quotas, securing IIS sessions and auditing local sessions.

UserLock 6.0: new features and enhancements

Time quotas

UserLock 6.0 allows defining and enforcing daily, weekly and monthly connection time quotas. This can be done per user, user group, Organizational Unit and session type.

The consumed time status can be checked by the network administrator in UserLock's console and the time remaining is automatically displayed at login to the concerned users.

Protection of Internet Information Services (IIS) sessions

UserLock 6.0 allows defining and enforcing the number of maximum concurrent IIS sessions for a specific IIS application like Outlook Web Access or an Intranet site.

Tighter integration with Active Directory

Every UserLock 6.0 restriction can be applied per user, user group, or Organizational Unit and the Active Directory tree can be directly displayed in the UserLock console.

Additional reports

UserLock 6.0 comes with three new reports for RAS/VPN sessions (history, statistics and a graphical report displaying the evolution of RAS/VPN sessions number). A fourth new graphical report also displays the evolution of the total opened sessions over a given period of time.

Sessions with local accounts

Local sessions are now audited and displayed in UserLock 6.0 console and can be remotely logged off.

Improvements

UserLock 6.0 overall performance has been greatly improved (especially in very large environments). Synchronization with UserLock Backup server and with Active Directory is now more efficient.
